

# Raw Data Upload to Amazon S3

Overview of the upload process for **store\_data.csv** to the **lab-avengers-datalake-2026** bucket, **raw/** folder.

This document summarizes, with visual evidence, the upload process of the electronics store data file (**store\_data.csv**, 3.8 MB) to an Amazon S3 bucket inside the **raw/** folder (the raw data zone, prior to any cleaning or transformation). Below is an explanation of each attached screenshot.

## 1. S3 Upload Configuration

This screenshot shows the **Upload** screen of the Amazon S3 console, before confirming the operation. It shows:

- The selected file: **store\_data.csv** (type text/csv, 3.8 MB).
- The upload **destination**: `s3://lab-avengers-datalake-2026/raw/`, i.e. the **lab-avengers-datalake-2026** bucket and, within it, the **raw/** folder, which is typically used as the landing zone for unprocessed data.
- The **Permissions** section, where public access or access from other AWS accounts is defined (as a best practice, this should remain restricted).

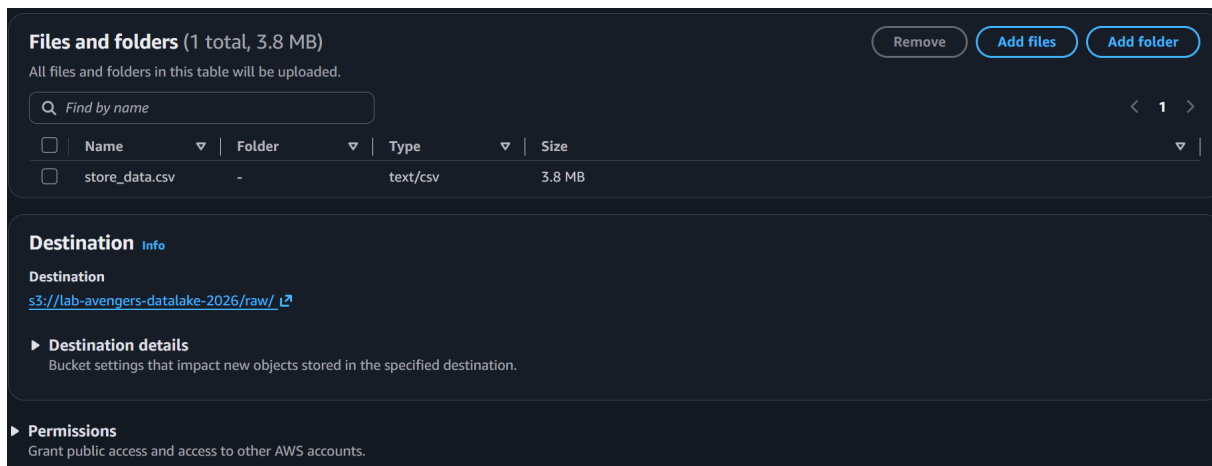

Figure 1. Upload configuration screen showing the destination in S3.

## 2. File Confirmed Inside the Bucket

Once the upload completed, this screenshot confirms the object now exists inside the bucket's **raw/** folder. The S3 console shows:

- Object **name**: `store_data.csv`.
- **Type**: csv.
- **Last modified**: September 3, 2026, 13:39:58 (UTC-06:00).
- **Size**: 3.8 MB.
- **Storage class**: Standard.

This confirms the upload was successful and that the file is now available in the data lake's *raw* layer, ready to be processed by a cleaning/transformation pipeline (for example, using AWS Glue, Lambda, or a Python/Pandas job).

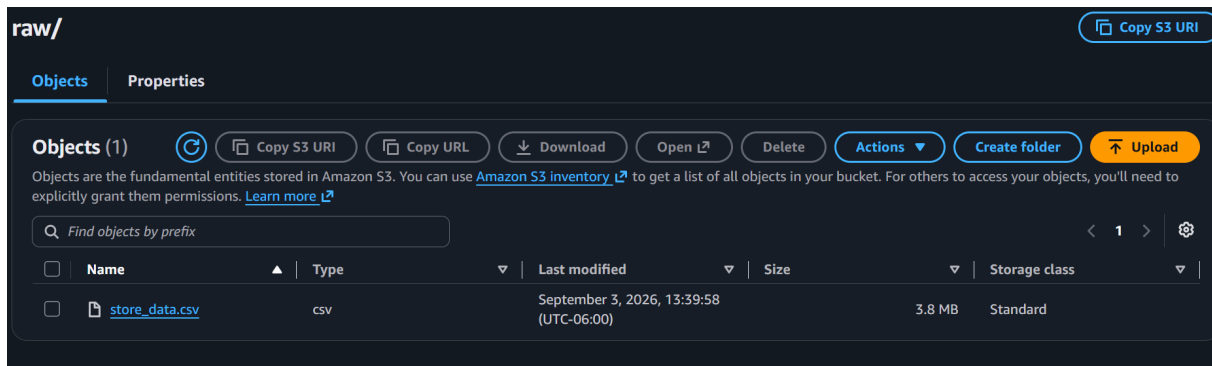

Figure 2. *store\_data.csv* object visible inside the bucket's *raw/* folder.

### 3. Preview of the File's Raw Content

This last screenshot shows the **store\_data.csv** file opened in Visual Studio Code, displaying the detail of the **raw** (uncleaned) data prior to any transformation. Among the visible columns are:

- **Order/customer identification:** id\_pedido, fecha\_pedido, id\_cliente, nombre\_cliente.
- **Contact data:** email, telefono, ciudad, pais.
- **Sale data:** canal\_venta, categoria, marca, producto, sku, cantidad, precio\_unitario.

As expected for raw data at this stage, several inconsistencies can be observed: different date formats from row to row (ISO, dd/mm/yyyy, values like N/A or 0000-00-00), mixed uppercase/lowercase country and city names (Colombia / colombia / COL), empty or inconsistently formatted phone numbers and emails, and extra whitespace in some names.
